                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides a monoclonal antibody which has a specific reaction with the part peptide of the C-terminal of 1992 ligand or ita derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of prolactin secretion), centrai nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivative. Sequences AAY49290-302 represent peptide fragments of the 1992 ligand.
Human; corticotrophin releasing hormone; CRH; G protein receptor ligand analgesic; hyperaldosteronism; hypercortisoiaemia; hypoadrenocorticism; Addison's disease; adrenal gland hyperfunction; obesity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a modified therapeutic peptide (1) CC comprising a therapeutically active amino acid region (III) and a creactive group (11) (e.g. auccinimidyi and malelmido groupa) attached to creactive group (11) (e.g. auccinimidyi and malelmido groupa) attached to compose a therapeutically active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptides e.g. hormones, growth (1) are useful for modifying therapeutic peptides e.g. hormones, growth (1) are useful for modifying therapeutic peptides e.g. hormones, growth (1) are useful for modifying therapeutic peptides e.g. hormones, growth (1) are useful for an experiment of various disorders. Endogenous therapeutic peptides are not auitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and specificity as bonding to increase length of activity (half (1) and (1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a peptide fragment from a novel human type CC ligand polypeptide corresponding to amino acid residues 34 to 54 of the sequence represented in AAW31390 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function CC modulator. This ligand could have specific applications as a complete composition or therapeutic syndication of prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of conaciousness. anxiety syndrome, schizophrenia, cc syndrome, disturbance secretory disease, hyper-and polyphagia, cc hyperlipidaemia, hypercholesterolaemia, hyperglyceridaemia, hyperprolactinaemia, disbetes, cancer. pancreatitis, renal disease, hyperprolactinaemia, neurosis, asthma, rheumatoid arthritia, spinal injury, transient brain ischaemia, epilepsy, amylotrophic lateral aclarosis, cc contern myocardial infarction, lifertility, spinocerebellar degeneration, cc consernation, atopic dermatitis, osteoporosis and/or consernation of the G protein-coupled receptor protein.

                           The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analgesic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadremocorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel oxytocin secretion-regulating agent which contains a ligand peptide or its sait for the g protein-coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and plg. This sequence represents a human peptide which acts as an oxytocin secretion
                                                                                                                                                                                                                                                                                 Disclosure;

                                                                ligand polypeptide corresponding to amino acid residues 34 to 55 of the sequence represented in AAW31390 and is used in an assay to monitor ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancreatic function modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper- and polyphagia, hyperlipidaemia, hypercholesteroiaemia, hyperglyceridaemia, hypercholesteroiaemia, hyperglyceridaemia, figure, and polyphagia, hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, hyperrolactias, spinal injury, transfent hasin tachaemia, antienay ambumatoid arthritis, spinal injury, transfent hasin tachaemia, antienay ambumatoid arthritis, spinal injury.

                                                                                                              This invention describes a novel oxytocin secretion-regulating agent which contains a ligand peptide or its salt for the G protein-coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analysisc or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addison's hypercorticism, and the control of the control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of G prote corticotropin

                                                                                  밁
                                                                                                                                                                                                                                                      This sequence represents a peptide fragment from a novel human type CC ligand polypeptide corresponding to amino acid residues 23 to 53 of the Sequence represented in AAW31390 and is used in an assay to monitor CC ligand binding to the G protein-coupied receptor protein. Pharmscentical compositions containing this ligand may be used as a pituitary function CC modulator, a central nervous system modulator or a pancreatic function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC traums, growth hormone secretory disease, hyper-and polyphagia, CC hyperilpideemia, hypercholesterolaemia, hyperglyceridaemia, hyperprolactinsemis, diabetcs, cancer, pancreatitis, renai disease, CC hyperprolactinsemis, diabetcs, cancer, pancreatitis, spinal injury, CC transient brain ischaemia, epilepsy, amylotrophic lateral sclerosis, acute myocardial infarction, infertility, spinocerebellar degeneration, CC bone fracture, trauma, atopic dermatitis, osteoporosis and/or capsble of sltering the binding sctivity of the ligand affecting CC activation of the C protein-coupled receptor protein.
                                                                                                                                             Query Match

OM protein - protein search, using sw model

Run on: September 13, 2002, 09:30:47 : Search time 80.21 Seconds (without alignments) 6.758 Million cell updates/sec

Title: Perfect score: Sequence: US-09-446-543A-73\_COPY\_8\_21

1 WYXXRG1RPVGRFX 14

Scoring table:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Searched: 105224 seqs, 38719550 residues 105224

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0
MBximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt\_40:\*

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

J. Mol. Biol. 148:303-330(1981).
-!- FUNCTION: ENDODEDXXIBDNUCLEAGE I, WHICH IS EXPRESSED IN THE STAGE, IS NECESSARY FOR T7 GENETIC RECOMBINATION AND THE BR DF HOST DNA. IN THE EARLY STAGE OP INFECTION, T7 DNA REPLICATES A LINEAR MONDMER. IN THE LATE STAGE, THE T7 DNA REPLICATES LINEAR CONCATEMERS SEVERAL GENDMES IN LENGTH. THE GENE 3 PRINTS ALSO BEEN IMPLICATED IN THE MATURATION DF THESE CDNCATE HAS ALSO BEEN IMPLICATED IN THE MATURATION DF THESE CDNCATE CATALYTIC ACTIVITY: Endonucleolytic cleavage to 5'-

- FUNCTION: BIOIRECTIONALLY DEGRADES SIMELE-STRANDED ON INTACTOR ACTO-INSOLUBLE OLIGONOCLEGATIDES, WHICH ARE THEN DEGRADED FINTO SMALL ACID-SOLUBLE OLIGONUCLEOTIOES (BY SIMILARITY).

- CATALYTIC ACTIVITY: EXONUCLEOLYTIC CLEAVAGE In either 5'-
or 3'- to 5'-direction to yleid 5'-phosphomononucleotides.

- SUBUNIT: HETEROOLIGOMER COMPOSED OF LARGE AND SMALL SUBUNIT

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

DOMAIN: HAS A TWO DOMAIN STRUCTURE: THE G-DOMAIN BINDS GTP; TN

M-DOMAIN BINDS THE 7S RNA IN PRESENCE OF SRP19 AND ALSO BINDS

SIGNAL SEQUENCE (BY SIMILARITY).

SIMILARITY: BELONGS TO THE SRP FAMILY OF GTP-BINDING PROTEINS.
